

“RegTrack” security solution now available for Windows 7 and 8

Mobile solution for iOS and Android is already being tested

Osnabrück/Berlin, 30 October 2012.

After the successful launch on the Mac market, adapted versions for Windows 7 and Windows 8 are now being released.

After having successfully conquered the Mac market in the last 18 months, with more than 20,00 active users in the meantime, Regman GmbH is now extending its activities to additional platforms, being supported by its exclusive retail sales partner GRAVIS.

Compatible with Windows 8 from the beginning

With the release of the Windows version, the tested and tried functions of the Mac software are not only available for Windows 7, but parallel to the introduction to the market, they are also available for the latest version 8 of the Microsoft operating system.

“Within the scope of an extensive Beta test in which, besides well-known systems houses, institutions of higher education were involved in a supportive way, we were able to ascertain that our cross-operating system solution functioned perfectly“, the head of the technical development, Christian Glasmeyer, states.

The Windows version, as with the already established version for the Mac operating system, can be obtained online via Regmann.de for 29.90 EUR and in GRAVIS branches. OEMs and assemblers can obtain licences directly via Regman GmbH.

The “Kill-Switch” becomes a professional tool

The functions of the “Kill Switch”, for which several patents are applied for, will be available at the turn of the year as a professional version which, starting with the Mac version, shall solidify the advantage of the “Security Solution Made in Germany”. An upgrade for the existing installation is planned. This new technology will also be available for the Windows version.

The Kill Switch function in the RegTrackPro package for the recommended retail price of 49.90 EUR facilitates in the case of loss, the deletion of all data on the protected computer concerned –via remote control.

The remote delete function is protected against misuse on several levels.

It was the initiative of banks and insurance companies that triggered the integration of this function because their concern above all was the deletion of sensitive data; the localisation of a stolen computer is of secondary importance to them.

With new versions also on Tablets and Smart phones

Besides MacOS X and Windows, Regman GmbH will also be offering its innovative security software for the mobile operating systems iOS und Android in the very near future. Sights have been set at the first quarter of 2013 for the official launch. The first test versions which offer a scope of functions comparable with the desktop versions are already in the testing phase.

Heiko Pohlmann, executive partner of Regman GmbH explains: “After a successful launch into the world of Apple, with more than 20,000 users in the meantime, it is our pleasure to now be able to offer the numerous users of Windows, Android and iOS a solution.

With the release of the versions for these platforms, we see huge opportunities for our company. To me as founder, it is particularly important that we have been profitable at all times since our foundation in 2008 and have been able to finance our growth from our own pockets.”

About Regman GmbH

Regman GmbH was founded by Heiko Pohlmann in Berlin in 2008. One year later, the company moved to the Lower Saxon City of Osnabrück. There, in close proximity to the university and the college, it has established its own software development since the summer of 2010, the first product being the RegTrack software for MacOs in the spring of 2011.

RegTrack will now be successively extended to a cross-system security solution with the Windows version presented above.

GRAVIS and Regman – Partners for security in mobile computing

GRAVIS has been trustfully collaborating with Regman GmbH for more than three years now.

“We find it very impressive to see how stolen or lost devices are recovered and returned to their owners”, states Archibald Horlitz, CEO of GRAVIS and adds: “We are pleased that this innovative technology will soon also be available for iOS and other important operating systems such as Android and Windows”.
